Project Proposal: The domain for which my database is the Big 5 Academy Award winners and nominees. Big5 is a structural database that traces all films nominated at the Academy Awards for their 5 above the line categories including Best Picture, Best Director, Best Actor, Best Actress, and Best Screenplay (Original or Adapted). This database includes 7 entities which are Film, Person, Best Picture, Best Director, Best Actor, Best Actress, and Best Screenplay. The ER diagram would describe the relationship these nominations have with one another and accounting for a film and its actors, director(s), and writer(s) that are nominated in their respective category for each year this instance occurred.

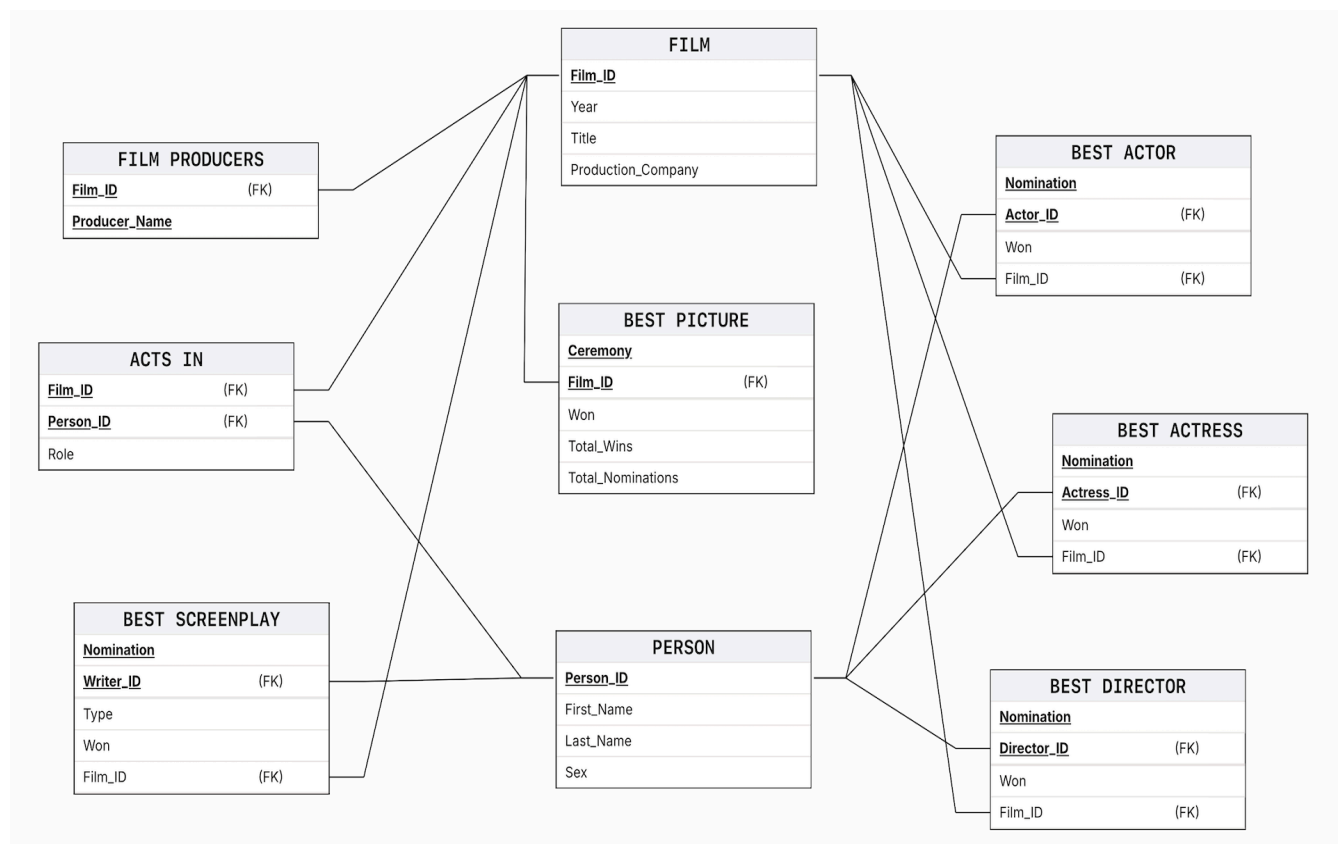

ER DIAGRAM 3NF

Applied Chen notation to design ER diagrams and relational schemas that were later converted into MySQL tables for the database. Film and Person represent strong entities while the other 5 entities that represent the big 5 categories of the Academy Awards function as weak entities with

[nomination] as their partial identifier that eventually pairs with the primary key of Person to fully be a unique identifier. They exist as weak entities because they depend on the Person and Film existing. For example, the Best Director entity had no unique identity aside from the partial identifier that is [nomination] for a certain instance (number) a person received a nod. The nomination entities are modeled as weak entities because they have no independent identity. A director nomination cannot exist without a film and a person, and its identity derived from those identifying entities together. This is true for every weak entity present in the diagram and database schema.

RELATIONAL SCHEMA 3NF

The relational schema showcases all tables and their relationships to one another. In addition, showcasing each table's primary key in bold underline and its foreign key (FK) meaning what table it's referencing.

TABLES WITH ENTITIES AND ATTRIBUTES

FILM

<u>FILM ID</u>	<u>YEAR</u>	<u>TITLE</u>	<u>PRODUCTION COMPANY</u>

PERSON

<u>PERSON ID</u>	<u>FIRST NAME</u>	<u>LAST NAME</u>	<u>SEX</u>

PRODUCERS

<u>FILM ID</u>	<u>PRODCUER NAME</u>

ACTS IN

<u>PERSON ID (FK)</u>	<u>FILM ID (FK)</u>	<u>ROLE</u>

BEST PICTURE

<u>CEREMONY</u>	<u>FILM ID (FK)</u>	<u>TOTAL_WINS</u>	<u>TOTAL_NOMINATIONS</u>	<u>WON</u>

BEST ACTOR

<u>NOMINATION</u>	<u>ACTOR ID (FK)</u>	<u>FILM ID (FK)</u>	<u>WON</u>

BEST ACTRESS

<u>NOMINATION</u>	<u>ACTRESS ID (FK)</u>	<u>FILM ID (FK)</u>	<u>WON</u>

BEST DIRECTOR

<u>NOMINATION</u>	<u>DIRECTOR ID (FK)</u>	<u>FILM ID (FK)</u>	<u>WON</u>

BEST SCREENPLAY

<u>NOMINATION</u>	<u>WRITER ID (FK)</u>	<u>FILM ID (FK)</u>	<u>TYPE</u>	<u>WON</u>

CREATING SCHEMAS ON MYSQL

```
CREATE DATABASE IF NOT EXISTS big5db;
```

```
